

Core Hypothesis

• Shots under pressure are less likely to be successful

About Our Data

- 2014-15 NBA Season
- 281 Unique Shooters
- 474 Unique Defenders
- 128069 Shots Taken
- We have 1 pair of players with the same name.
- CSV file found on Kaggle

Splitting the Clock

```
to_clean= cleaned_df["GAME_CLOCK"].str.split(":",expand=True).astype(int)
  cleaned_df["GAME_CLOCK_SECONDS"]=to_clean[0]*60 + to_clean[1]

to_clean.rename(columns={0: "MINUTES", 1: "SECONDS"}, inplace=True)
# print(to_clean)
#merge into cleaned_df
cleaned_df=pd.concat([cleaned_df, to_clean], axis=1)
```

Data Wrangling

- Shot clock is not started if there is <24 seconds in the quarter.
 - As a result, I had to fill NaN with how many seconds were left on the game clock.
 - There were also NaN values for other game clock values, those had to be dropped.

cleaned_df["SHOT_CLOCK"].fillna(cleaned_df["SECONDS"], inplace=True)

- Dropped some columns we weren't using.
- Game clock column is object due to "minutes: seconds". Must convert.

Adding Game Time in Seconds

```
cleaned_df["TOTAL_TIME_SECONDS"] = ""
for index,rows in cleaned_df.iterrows():
    multiplier= 0
    if rows["PERIOD"] == 1:
        multiplier= 36*60
    elif rows["PERIOD"] == 2:
        multiplier= 24*60
    elif rows["PERIOD"] == 3:
        multiplier= 12*60
    cleaned_df.loc[index,["TOTAL_TIME_SECONDS"]]=multiplier+cleaned_df["GAME_CLOCK_SECONDS"][index]
cleaned_df
```

Buzzer Beaters

- Everyone remembers buzzer beaters, but how accurate are they?
- Who is the best in the clutch?
- When is the best time to shoot the ball?

Who is the most clutch?

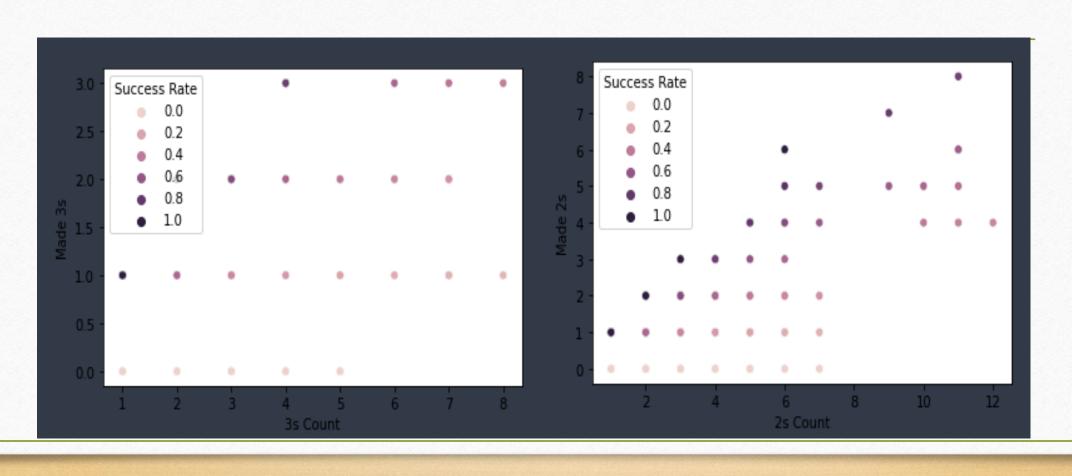

- Clutch is < 24 seconds left in game
 - 1 score game (+/- 3 pts)
- Ranking regardless of Win or Loss

Are Open Shots Made More Often Than Contested Shots?

- What distance from the defender is considered open?
 - We used 6ft as the cut off.

• Our hypothesis: Open shots will be made at a higher frequency than contested shots.

Finding Defender Distance

Open

pie.savefig("Contested.png")
```

Conclusion

• Contested shots were made more often than open by only 0.68%.

Who are the NBA's best defensive players based on FG block %?

- How will this be determined/What are our parameters?

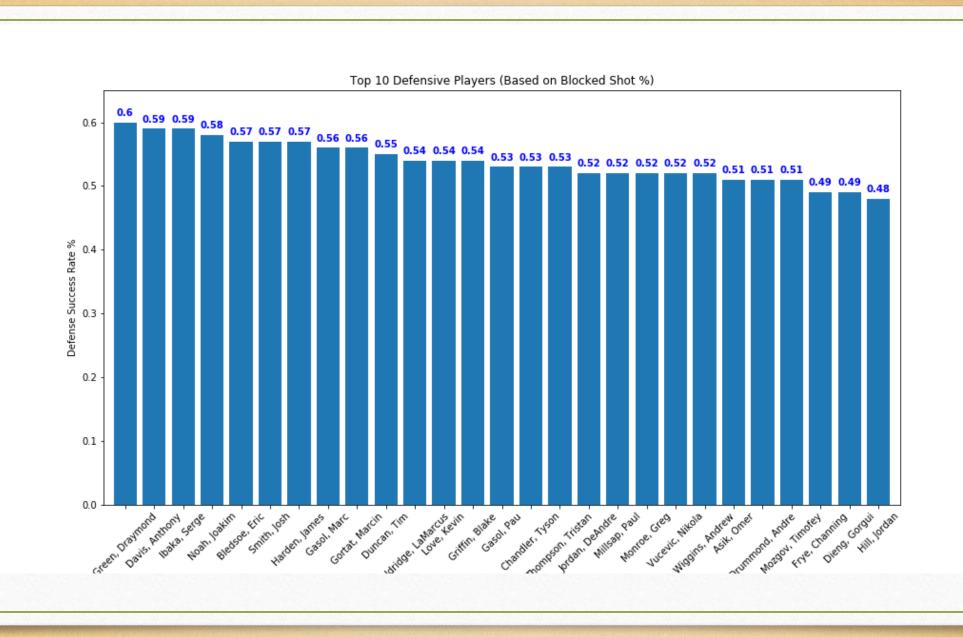

- Hypothesis: Whoever they are, their block percentages should roughly add up to 100% when combined with FG success rates.

First Thought

Is FG success rate affected by quarter or total time left on GAME clock?

• Hypothesis: Yes, the further along in the game, the more tired the players will be and thus, we will be likely to see a decrease in success rate as game progresses.

What calculations and functions did we use to determine this?

- FG success rate does decrease by quarter except, it appears, right after half-time when they've all had time to rest.
- NBA's best defenders compared to FG success rates:

	Shot Success Rate (%)
Time Remaining on Game Clock (Seconds)	
720-0 (4th QTR)	43.90%
1439-720 (3rd QTR)	45.72%
2159-1440 (2nd QTR)	45.11%
2880-2160 (1st QTR)	46.05%

	No. of Times Closest Defender	No. of FG made against	No. of successful defenses	Success Rate
CLOSEST_DEFENDER				
Green, Draymond	751	301	450	0.600000
Davis, Anthony	609	247	362	0.590000
Ibaka, Serge	814	334	480	0.590000
Noah, Joakim	632	267	365	0.580000
Bledsoe, Eric	650	280	370	0.570000
Smith, Josh	651	278	373	0.570000
Harden, James	607	264	343	0.570000
Gasol, Marc	629	274	355	0.560000
Gortat, Marcin	688	302	386	0.560000
Duncan, Tim	637	286	351	0.550000

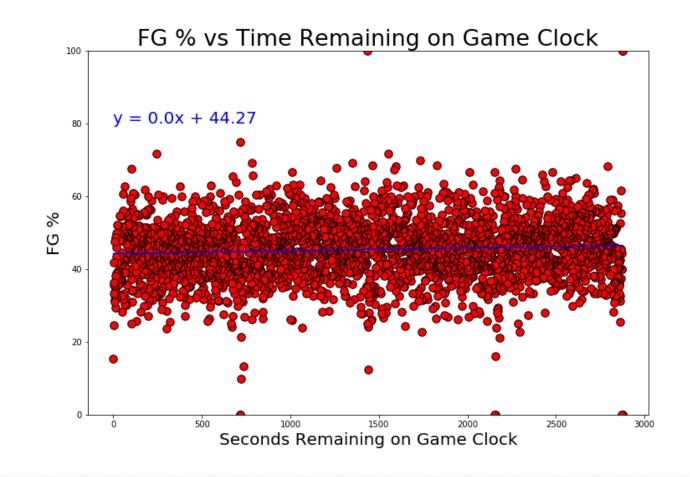

Is the FG success rate correlated to the remaining game clock?

- Hypothesis: As the game goes on and players get tired, the success rate % will decrease slightly.

4th Quarter slump: Fact or Fiction?

- No strong correlation between FG success rate and game progression. (Very slightly negative as expected but not statistically significant.)

Does field goal percentage (FG%) decrease in the final 5 seconds of the shot clock?

• Is there a correlation between FG% and the time remaining on the 24 second shot clock?

• Hypothesis – Yes, there is a correlation. We think the FG% will be lower in the last 5 seconds of the shot clock.

How will we test our hypothesis?

```
shot clock timepoints = cleaned df.groupby(["SHOT CLOCK"])
shot clock remaining = shot clock timepoints["SHOT CLOCK"].unique()
shot_clock_shots = shot_clock_timepoints["SHOT_CLOCK"].count()
shots made = shot clock timepoints["FGM"].sum()
fg percent = shots made / shot clock shots * 100
# make a new dataframe for graphing
graph df = pd.DataFrame({
    "FG Attempts": shot clock shots,
    "FGs Made": shots made,
    "FG%": fg percent
graph_df = graph_df.reset_index()
graph_df = graph_df.rename(columns={"SHOT CLOCK": "Shot Clock"})
graph_df
```

FG % vs Time Remaining on Shot Clock % 5₄ y = 0.9x + 34.03Seconds Remaining on Shot Clock

Correlation between FGs and time left on shot clock

•The r-value is: 0.806

•There is a strong correlation between these data points Is there a difference between 2-point shots and 3-point shots?

two_pointer = cleaned_df.loc[cleaned_df["PTS_TYPE"] <= 2]
three_pointer = cleaned_df.loc[cleaned_df["PTS_TYPE"] > 2]

Correlation between 2point shots and time left on shot clock

•The r-value is: 0.800

•There is a strong correlation between these data points.

3 pt FG % vs Time Remaining on Shot Clock y = 0.36x + 30.97FG % Seconds Remaining on Shot Clock

Correlation between 3point shots and time left on shot clock

•The r-value is: 0.349

•There is a weak correlation between these data points.

Conclusion

• The FG% is the lowest in the final 5 seconds of the shot clock.

What is the FG% at other timepoints on the shot clock?

```
bin size = [0, 5, 10, 15, 20, 24]
bin_label_size = ["0-5", "6-10", "11-15", "16-20", "21-24"]
graph_df["Shot Clock"] = pd.cut(graph_df["Shot Clock"], bin_size, labels=bin_label_size)
shot_clock_binning = graph_df.groupby(["Shot Clock"])
fg percentage = shot clock binning["FG%"].mean()
bin df = pd.DataFrame({"Overall FG %": fg percentage})
bin df["Overall FG %"] = bin df["Overall FG %"].map("{:.2f}".format)
bin df
```

FG Attempts FGs Made FG% Shot Clock 5904 36.58 16140 0-5.0 13380 43.59 30698 5.1-10.0 38555 17234 44.70 10.1-15.0 27391 12958 47.31 15.1-20.0 7799 57.79 13496 20.1-24

FG% at other shot clock timepoints

- FG% decreases as shot clock decreases
- Lowest in final 5 seconds
- Highest in first 4 seconds

Results

• Pressure does affect performance

• Any questions?
